Biomechanical Assessments and Gait Analysis

Our bodies are subjected to a great deal of force during our normal day to day activities. These forces put strain on particular parts of our body and, when these forces exceed what our bodies are happy with, injuries can occur.

Most of the injuries we see are chronic and have been going on for a while. Using a range of assessment techniques we can investigate your symptoms, identify what is hurting and understand how it has happened. We can then discuss the various treatments that we think will be of benefit to you.

What could this help with?

- Shin pain
- Heel pain
- Ankle pain or instability
- Forefoot pain
- Achilles issues
- Tendon injuries

Our Services

- Biomechanical Assessment
- Gait Scan with RSScan mat
- Gait Video Assessment
- Running Gait Retraining
- Custom Orthoses
